SPORES VI

EDITORS:
Philipp Gerhardt, Harold L. Sadoff, and Ralph N. Costilow

This new book comprises papers selected from the **Sixth International Spore Conference,** held at Michigan State University, October 10-13, 1974.

Comparative sporology of diverse microbes, other than the Bacillaceae, is one main theme of this volume. A series of review articles brings together critical assessments of what is known and what is not known about prokaryotic and eukaryotic spores and similar resting bodies of the following groups: actinomycetes, myxobacteria, azotobacter, slime molds, blue-green algae, fungi, and yeasts.

Molecular aspects of developmental biology constitute the second major theme of this volume, represented in a group of papers on the widely studied spores of *Bacillus* and *Clostridium*. Molecular control and regulation of differentiation dominate study of the cellular processes of sporulation and germination in the next two sections. Papers on dormancy and resistance comprise a fourth section, while a fifth section includes updated genetic maps of *Bacillus subtilis* and papers on special methods used in spore research.

SPRING 1975, **619 pages,** illustrated, $15.00
